DATA HANDLING AND VISUALIZATION LABSHEETS

NAME: KUSHAL GOWDA R
ROLL NO: 20201ISE0033

LABSHEET-1
INTRODUCTION TO NUMPY

```
  import numpy as np
a=np.array([1,2,3])
b=np.array([1,2,3])
  add=np.add(a,b)
add   array([2, 4,
6])
a=np.array([5,10,20]
)
b=np.array([4,8,10])
  sub=np.subtract(a,b)
sub   array([ 1, 2,
10])

a=np.array([5,10,20])
b=np.array([4,8,10])
  sub=np.multiply(a,b)
sub   array([ 20, 80,
200])
a=np.array([5,7,9]
)
b=np.array([4,5,6]
)
sub=np.mod(a,b)
sub   array([1,
2, 3])
a=np.array([1,2,3]
)
b=np.array([1,2,3]
)
  add=np.power(a,b)
add
  array([ 1, 4,
27])
```

Series creation

```
import pandas as pd import numpy as np data=np.array(['a','b','c','d'])
s=pd.Series(data) print(s)
0  a
1  b
2
3  c

d

dtype: object
```

Series with index

```
import pandas as pd import numpy as np
data=np.array(['a','b','c','d'])
s=pd.Series(data,index=[101,102,103,104]) print(s)
```

```
101  a
102  b
103  c
104  d
dtype:
object
```

Series with Dictionary

```
import pandas as pd import numpy as
np  data={'a':  0.,'b':  1.,'c':  2.}
s=pd.Series(data) print(s)
```

```
a 0.0
b    1.0
c    2.0
dtype: float64
```

Series with Dictionary with index

```
import pandas as pd import numpy as np
data={'a':        0.,'b':        1.,'c':        2.}
s=pd.Series(data,index=['b','c','d','a']) print(s)
```

```
b
     1.0 c
    2.0 d
     NaN a
    0.0
dtype: float64
```

Create Series from Scalar

```
import pandas as pd import numpy as np
s= pd.Series(5, index=[0,1,2,3])
print(s)
```

```
0  5
  1    5
  2    5
```

```
3    5
dtype:
int64
```

Retrieving data from the zeroth position

```
import          pandas          as          pd                    s=
pd.Series([1,2,3,4,5],index=['a','b','c','d','e']) print(s[0])
1
```

```
    import
pandas as pd
s=
pd.Series([100,101,102,103,104,105,106,107,108,109,110],index=['a','b','c','d','e','f',
'
g
','h','i','j','k']
) print(s[:3])
a 100 b
     101
c    102
dtype: int64
   import pandas
as pd
s=
pd.Series([100,101,102,103,104,105,106,107,108,109,110],index=['a','b','c','d','e','f',
'
g ','h','i','j','k']) print(s[2:8])
```

```
c
    102 d
    103 e
    104 f
    105 g
    106 h
     107
dtype: int64
```

Using lable value

```
import pandas as pd
s=
pd.Series([100,101,102,103,104,105,106,107,108,109,110],index=['a','b','c','d','e','f',
'
g
','h','i','j','k'])
print(s['a']) 100
import pandas as pd
s=
pd.Series([100,101,102,103,104,105,106,107,108,109,110],index=['a','b','c','d','e','f',
'
g
```

```
','h','i','j','k'])
print(s[['a','e','i','d']])
```

```
a
100 e
104 i
108 d
103
dtype: int64
```

Data Frames

```
import pandas as pd
df=pd.read_csv("/content/nyc_weather.csv")
```

Create data frame with empty data

```
import pandas as pd df=pd.DataFrame()
print(df)
```

```
Empty DataFrame Columns: []
Index: []
```

Create data frame from list

```
import pandas as pd data=[1,2,3,4,5]
df=pd.DataFrame(data) print(df)
```

```
   0
0  1
1  2
2  3
3  4
4  5
```

```
   import pandas as pd
data=[['Alex',10],['Bob',12],['Clarke',13]
]
df=pd.DataFrame(data,columns=['Name','Age']) print(df) Name Age
Alex  10
```

```
Bob  12
Clarke 13
```

```
   import pandas as pd  data=[['Dha',21, 10001,'A'],['Sha',23,
10002,'B'],['Dee',22, 10003,'C']]
df=pd.DataFrame(data,columns=['Name','Age','Rollno','Sec'],dtype=float) print(df)
```

```
    Name Age Rollno Sec
0  Dha 21.0 10001.0 A
1  Sha 23.0 10002.0 B
2  Dee 22.0 10003.0 C
<ipython-input-31-f22448152035>:3: FutureWarning: Could not cast to float64, falling
back to object. This behavior is deprecated. I
df=pd.DataFrame(data,columns=['Name','Age','Rollno','Sec'],dtype=float)
```

Cretae data frame from Dictionary

```
import pandas as pd
data={'Name':['Tom','Jack','Steve','Ricky'],'Age':[23,25,22,29]
}
df=pd.DataFrame(data,index=['rank1','rank2','rank3','rank4'])
print(df)
```

```
Name Age rank1
    Tom 23 rank2
    Jack 25 rank3
```

Steve 22 rank4 Ricky
29

LABSHEET-2 WORKING WITH PANDAS

```
import pandas as pd    def
load_data(): df_all =
pd.read_csv('/content/train.csv')
return df_all.loc[:300,['Survived','Pclass','Sex','Cabin','Embarked']].dropna()
df=load_data()
```

LABSHEET-13

TIME SERIES DATA

A time series is the series of data points listed in time order.
A time series is a sequence of successive equal interval points in time.
A time-series analysis consists of methods for analyzing time series data in order to extract meaningful insights and other useful characteristics of data. For performing time series analysis download stock_data.csv

```
  import pandas as pd import numpy as
np import matplotlib.pyplot as plt

# reading the dataset using read_csv
df = pd.read_csv("/content/stock_data.csv", parse_dates=True, index_col="Date")
# displaying the first five rows of dataset df.head()
```

```

```

Next steps:

Generate code with df View recommended plots

We have used the 'parse_dates' parameter in the read_csv function to convert the 'Date' column to the DatetimeIndex format. By default, Dates are stored in string format which is not the right format for time series data analysis.

Now, removing the unwanted columns from dataframe i.e. 'Unnamed: 0'.

```
# deleting column
df=df.drop(columns='Name') print(df)
```

```

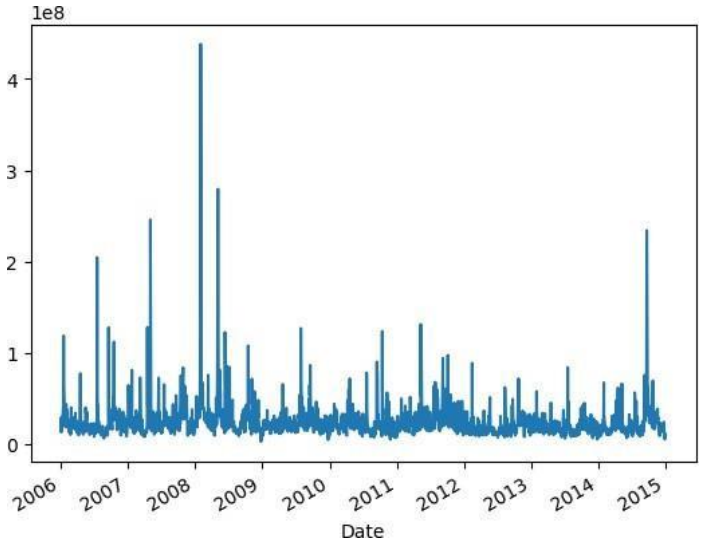
[2263 rows x 5 columns]
```

Example 1: Plotting a simple line plot for time series data.

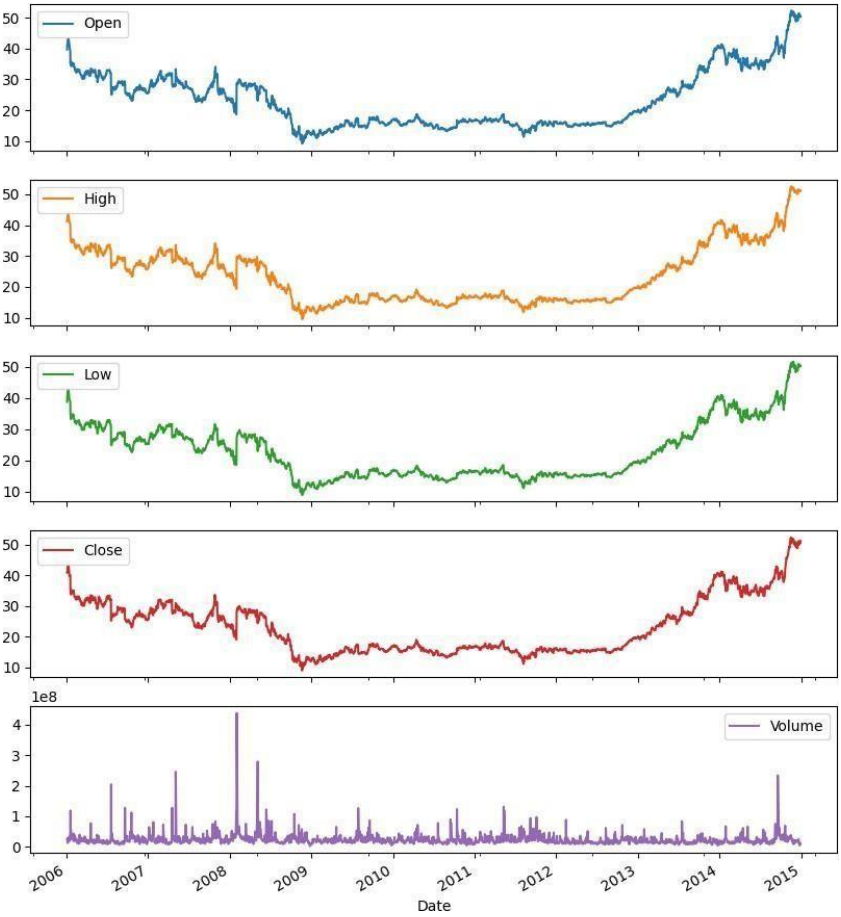
```
df['Volume'].plot()
```

```
<Axes:
xlabel='Date'>
```



Example 2: Now let's plot all other columns using subplot.

```
   df.plot(subplots=True, figsize=(10,
12))   array([<Axes: xlabel='Date'>,
<Axes: xlabel='Date'>,
<Axes: xlabel='Date'>, <Axes: xlabel='Date'>,
<Axes: xlabel='Date'>], dtype=object)
```



20201ISE0033

Resampling: Resampling is a methodology of economically using a data sample to improve the accuracy and quantify the uncertainty of a population parameter. Resampling for months or weeks and making bar plots is another very simple and widely used method of finding seasonality. Here we are going to make a bar plot of month data for 2016 and 2017. Example 3:

```
# Resampling the time series data based on monthly 'M' frequency df_month
= df.resample("M").mean() print(df_month)

# using subplot
fig, ax = plt.subplots(figsize=(10, 6))

# plotting bar graph
ax.bar(df_month['2012':'2014'].index, df_month.loc['2012':'2014', "Volume"],width=25,
align='center')
```

```

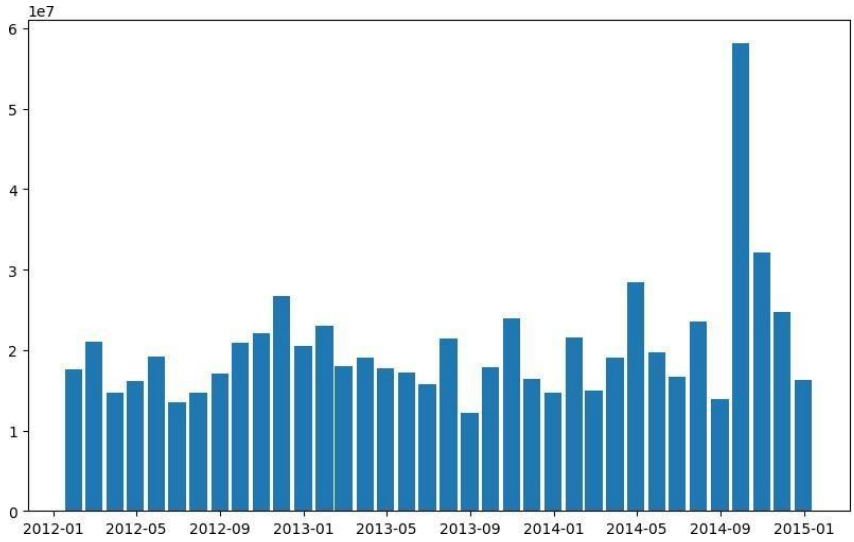
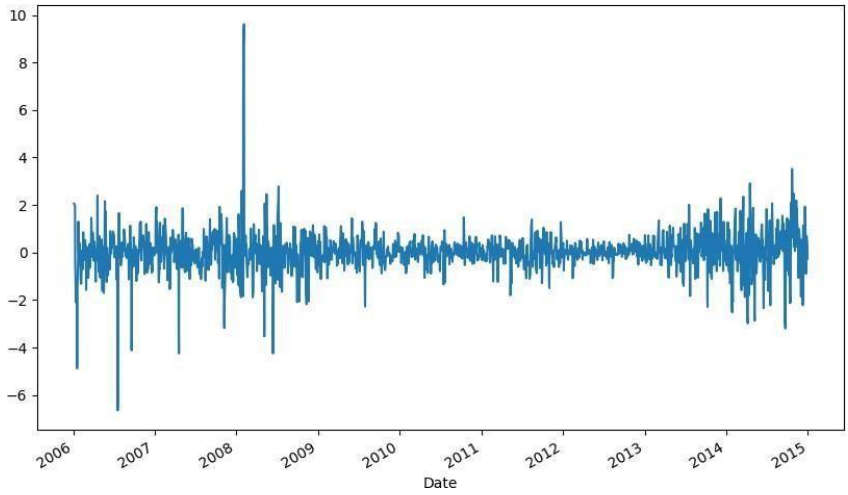
```



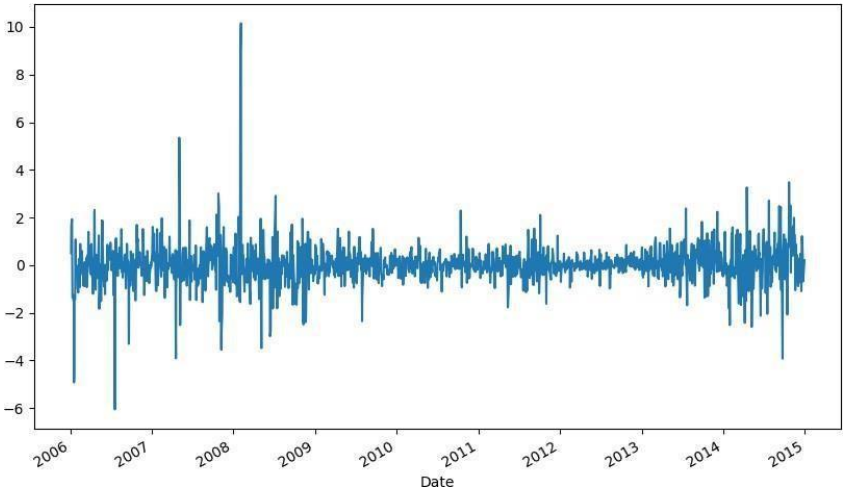
Differencing: Differencing is used to make the difference in values of a specified interval. By default, it's one, we can specify different values for plots. It is the most popular method to remove trends in the data.

```
df.Low.diff(2).plot(figsize=(10, 6))
```



```
df.High.diff(2).plot(figsize=(10, 6))
```

```
<Axes: xlabel='Date'>
```

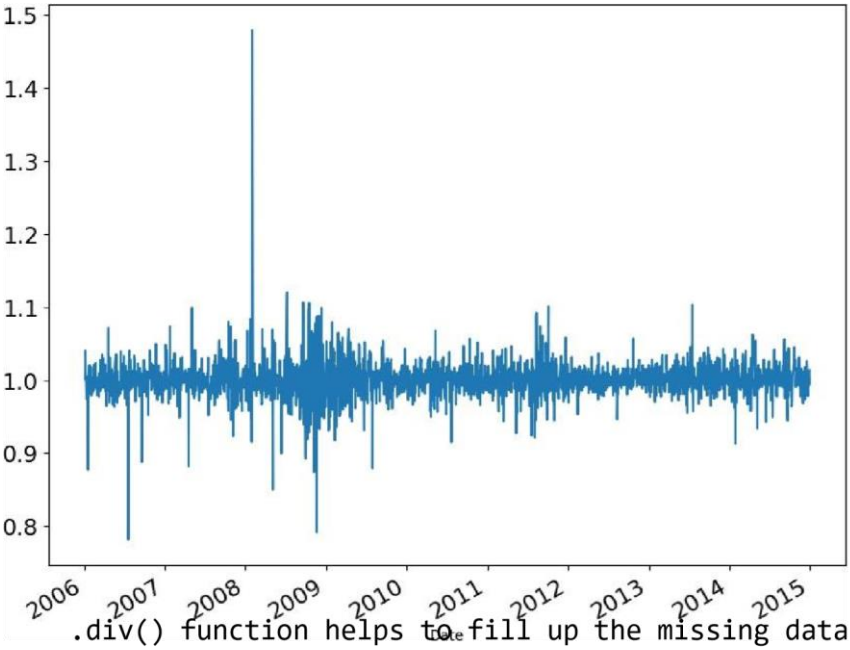


Plotting the Changes in Data

We can also plot the changes that occurred in data over time. There are a few ways to plot changes in data.

Shift: The shift function can be used to shift the data before or after the specified time interval. We can specify the time, and it will shift the data by one day by default. That means we will get the previous day's data. It is helpful to see previous day data and today's data simultaneously side by side.

```
df['Change'] = df.Close.div(df.Close.shift())
df['Change'].plot(figsize=(10, 8), fontsize=16)
```



.div() function helps to fill up the missing data values. Actually, div() means division.

If we take df. div(6) it will divide each element in df by 6.

We do this to avoid the null or missing values that are created by the 'shift()' operation.

```
df['Change'].plot(figsize=(10, 6))
< Axes: xlabel='Date'>
```
